

Block CON 6

Overview

Summary of Block CON 6

The onshore Lower Congo Basin is located in the northwest corner of Angola. Block CON 6 is located in the eastern part of this onshore basin and has an area of 631.97 Km² and borders Block CON 1 and Block CON 4 to the north on latitude 6° 26' 39", Block CON 7 to the east on longitude 12° 48' 18", Block CON 8 to the south on latitude 6° 38' 59" and the coastline to the west.

Block CON 6 has four exploration wells, Conda-Comba-1, Lussanga-1, Lussanga-2 and Quelo-1, which discovered hydrocarbon shows in both post-salt and pre-salt sequences. Lussanga-1 had a successful oil production test.

The principal tectonic events recognised within these two blocks are the Cretaceous syn-rift and post-rift phases followed by the development of a gentle westward dipping margin during the Tertiary.
